Resource 1A: Grammar activity

Look at these sentences and underneath each one circle the correct answer for that sentence.

Tip: relative clauses give more information about something and usually start with 'that' or 'which'.

1. Mercury, **which is the planet closest to the sun,** is the smallest planet in the Solar System.

Relative clause = green or purple? (circle the correct answer)

2. Saturn - **which was named after the Roman god of farming** - has thousands of rings.

Relative clause = green or purple? (circle the correct answer)

3. The Earth (**which is made up of over 70% water**) only has one moon.

Relative clause = green or purple? (circle the correct answer)

Resource 1B: Parenthesis support

Tip: relative clauses give more information about something and usually start with 'that', 'which', 'where', 'when'

Example sentences using information from the space [website](#) link:

- The rotation of the Earth, **which** was believed to be the centre of the universe, is gradually slowing down.
- The Earth's core, **that** has a powerful magnetic field, is a dense metallic structure.

Resource 2A: Example explanation text

Why do we have day and night?

Everyone has experienced day and night. Why do we have it? This text will explain about the Earth's rotation, why we have day and night and why the sun appears to move in the sky.

How does the Earth move?

The Earth, which is a **sphere**, **rotates** as it **orbits** the sun. It spins on its **axis** (an imaginary line passing through the North and South poles) but people cannot feel this movement because it turns smoothly and at the same speed. The Earth takes a whole day- which is 24 hours- to make a complete turn.

When do we have day and night?

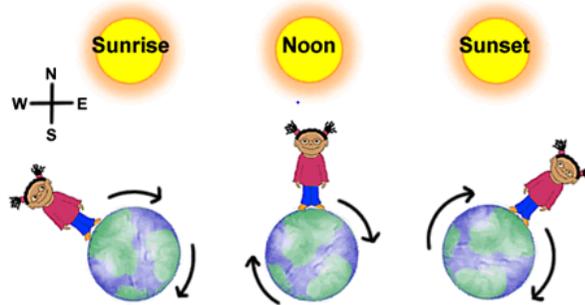

When Britain faces the sun, it is daytime in London. This is because the side of Earth that Britain is on, will be receiving the sun's light. Meanwhile, it would be nighttime in Honolulu as Hawaii is facing away from the sun. As the Earth continues to rotate, at

approximately 1000 miles per hour, Britain will face away from the sun. Consequently, it will be night time in London.

Why does the sun appear to move?

Many children believe that we have day and night because the sun moves, rising and setting.. This is not actually correct: the sun only appears to move across the sky. It seems to rise in the East in the morning, and set in the West

in the evening. This is actually because the Earth is spinning towards the east and the sun is not moving.

Glossary:

Orbit: the path an object takes when it goes around a star

Rotate: to turn about an axis or centre

Sphere: an object shaped like a ball

Resource 2B: Features of an explanation text activity

1.What is the title of the example text that you just read?

2.Give an example of a subheading from the text:

3. Find 3 examples of present tense:

✓

✓

✓

4.Find 1 example of impersonal language (e.g. not using 'I' or 'you'):

✓

5.Find 3 examples of technical language:

✓

✓

✓

6. Find 2 relative clauses: **Tip: relative clauses give more information about something and usually start with 'that', 'which', 'where', 'when'.**

✓

✓

7. Find 3 causal conjunctions (e.g. as a result, because, consequently, for this reason, therefore, due to)

✓

✓

✓

8. Sketch one diagram and caption that you might see in this text:

9. What order is the glossary in? Circle the correct answer:

chronological

alphabetical

Resource 3A: Reading comprehension

How does gravity keep us on the ground?

A force is a push or a pull on an object. All objects have a gravitational force, which pulls other objects towards them. The area within which an object's gravitational force has an effect is known as its 'gravitational field'. Only massive objects like planets are large enough for us to notice the effect of their gravitational fields. The Earth's gravitational field is like a friend who is with you all of the time, without you realising – it stops you floating away into space.

Discovering the secrets of gravity

For a long time, people wondered about why things did not float away and why they fell to the ground when we drop them. The Ancient Greeks believed that objects were trying to find their natural place and that the planets were moved by invisible crystal spheres. It was not until the 16th and 17th century that scientists began to understand gravity. Galileo Galilei made some important discoveries about how objects move; for example, that if there was no friction, once an object began to move it would never stop! Isaac Newton then built on Galileo's work to discover his laws of motion and gravitation. It is said that when Newton

saw an apple falling, he wondered if the force acting on the apple could be the same as the one acting on the moon and the planets!

What affects the gravitational force between objects?

The strength of the attraction between two objects depends on the size of the objects and how close they are to each other. The closer two objects are, the greater the strength of the attraction between them. Furthermore the larger an object is, the greater its gravitational pull; in fact we only notice the effect of the gravitational force of massive objects like planets.

What does gravity help to explain?

The planets orbit (move around) the sun because of the sun's gravitational force. Earth's gravitational force ensures that objects do not just float off into space, as well as attracting the moon so that it orbits around the Earth. The moon's gravitational force explains why the oceans have tides. The water in the Earth's oceans is drawn towards the moon by the moon's gravitational force.

Mass and Weight

When most people talk about their 'weight', what they are really talking about is their 'mass'. Mass is measured in grams and kilograms and is always the same for an object, no matter where the object is. Mass is a measure of the amount of matter (stuff) that an object contains. Weight is actually a force caused by gravity. Weight is a measure of the pull of gravity on an object's mass and is measured in Newtons (after Isaac Newton!). An object's weight will be different in different places. On the moon an object's weight is only one-sixth of what it is on Earth (because the moon is much smaller than the Earth), whereas on Jupiter an object's weight would be more than two and a half times as much (because Jupiter is much bigger than the Earth).

What happens without gravity?

The easiest way to see how gravity affects people and objects is to see what happens when gravity is absent. On Earth, people can take 'zero gravity' flights, where a plane travels quickly downwards to create a weightless environment. In space, astronauts can be weightless because they are not close enough to the Earth (or any other planet or moon) for the gravitational force of these bodies to have an effect on them.

Conclusion

Gravity is a crucial force for life on Earth and is responsible for the movements of all of the planets, the moon and the tides. It is only in the last several hundred

years that scientists have understood how it works. Larger objects have a greater gravitational force and we only notice the effect of the gravitational force of massive objects like stars, planets and moons. The weight of objects changes depending where they are; on larger planets objects have a greater weight, whereas on smaller planets and moons, objects have a lower weight.

Resource 3B: Comprehension questions

1. What is a force?
2. What is an object's gravitational field?
3. Which two scientists made important contributions to our understanding of gravity?
4. Which two factors affect the strength of the attraction between two objects that is caused by gravity?
5. Name three things that gravity helps us to understand.
6. Give two differences between mass and weight.
7. Why does an object weigh less on the moon than on the Earth?
8. Name two ways in which people can 'escape' gravity?

Resource 4A: Planning format

Title	What is so special about planet Earth?
-------	--

Intro	G	General fact about Earth:
	S	Specific point about Earth:
	ABC	The three things you are going to talk about in your information text: E.g time, satellites and _____
Topic (A)		Time
Evidence		Earth spins at 1000 miles per hour

Explanation		24 hours to rotate around axis once
Topic (B)		Satellites
Evidence		One natural satellite
Explanation		
Topic (C)		
Evidence		
Explanation		
Conclusion	ABC	Time, satellites and _____
	S	Specific point about Earth:
	G	General fact about Earth:
